

Integrated certificate and key management

iQ.Suite KeyManager

Everyone thinks of email encryption when it comes to the privacy and integrity of their electronic communications. This procedure is based on keys and certificates. However, in large-scale infrastructures with a lot of users involved, a vast number of keys and certificates soon accumulate. It is vital for companies to get them under control.

iQ.Suite KeyManager provides this control by enabling you to manage all your certificates and keys over one central interface. In fact, iQ.Suite KeyManager offers you much more than just ease of management. Another integral part of this solution is the automatic creation of certificates via official trust centres. Instead of having the awkward task

of generating certificates manually, the process can now be handled without any user interaction. This saves time and money.

iQ.Suite KeyManager is the key to greater visibility and efficiency in management of confidential email communication. In conjunction with our email management solution iQ.Suite, it allows users to benefit from a broad array of functions. iQ.Suite KeyManager communicates seamlessly with the encryption solution iQ.Suite Crypt and enables the use of stored certificates and keys for secure email communication. Integration in existing PKI infrastructures is possible as well as the connection to established providers (e.g. Verisign).

Your benefits:

- Standard storage for certificates and keys*
- Centralised, web-based administration
- Integration of official trust centres
- Automatic creation of certificates
- Connection to existing PKI structures
- Integration into the email management solution iQ.Suite
