iQ.Suite WebCrypt: Email encryption for everyone

Intellectual property is one of a business's most important assets, and when it comes to the exchange of this and other sensitive corporate information, confidentiality plays a critical role. For email, complex encryption methods like PGP and S/MIME have been addressing the challenge of confidentiality for years. iQ.Suite Crypt has been helping customers stay current with the latest email security requirements and methods since Day One.

Ensure confidentiality

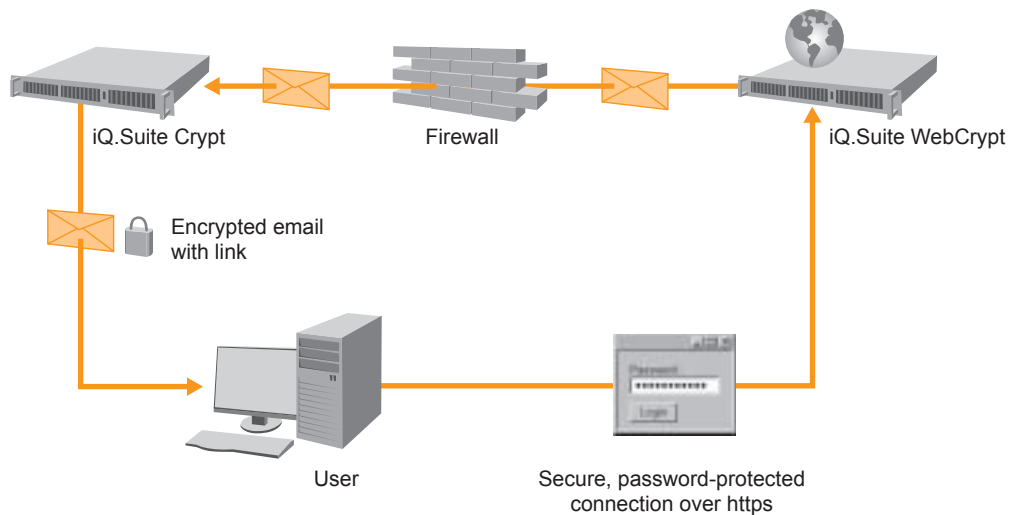

Most businesses have long recognized that failure to provide a secure process for exchanging information across corporate boundaries can have explosive consequences. Unfortunately, the implementation of an encryption solution that allows individuals from unrelated organizations to communicate within a secure environment is often difficult. This is because centralized encryption solutions ultimately require that all participants use the same encryption method, which in turn requires the deployment of method-compatible software on all sides, which is not always possible.

How can organizations rise to meet this email security challenge without opening the doors to industrial espionage? How can sensitive email be exchanged with customers and partners who don't have their own encryption solutions? And how can compliance with legal data protection mandates be maintained?

Protect your knowledge, secure your communication

iQ.Suite WebCrypt is the intelligent answer to these questions. It offers an easy and reliable way to safeguard your email communication with customers and business partners. As a supplement to iQ.Suite Crypt, it can be quickly and seamlessly integrated into your network and enables the immediate exchange of encrypted email without requiring your communication partners to install additional hardware or software.

Instead, encrypted messages are registered through a secure port on the WebCrypt server. The process is easy to visualize: You send an encrypted email as usual. Your communication partner receives a standard email containing the encrypted email as an attachment, and can review the encrypted content at any time by establishing a password-protected connection to the WebCrypt server. Saving encrypted attachments and creating secure responses is also supported. Because all content remains in the email recipient's possession and no actual content is saved on the WebCrypt server, potential requirements for retention and long-term storage never come into play.

Productivity in focus: Centralized management

The centralized management approach common to all GROUP solutions is also part of iQ.Suite WebCrypt. Administration tasks, as well as functions for sending and retrieving encrypted messages, are all initiated via a flexible web interface that makes working with iQ.Suite WebCrypt intuitive and easy. An integrated backup process ensures user data is always secure.

Raise the confidentiality and integrity of your organization's messaging process to pioneering levels. Cross corporate boundaries in security. Go beyond the usual limits with iQ.Suite WebCrypt.

iQ.Suite WebCrypt delivers more

- Protection of intellectual property and a simultaneous increase in communications efficiency
- Secure processes for confidential email correspondence without PGP, S/MIME or PKI structures
- No requirements for communication partners to install additional hardware and software
- Fast and seamless integration with iQ.Suite Crypt
- Centralized, integrated user management
- Scalable and flexible architecture
